

AFRICAN AI STARTUP MARKET RESEARCH

& Funding Intelligence — 2026

A source-verified research sample of 50 African AI-focused companies, covering company intelligence, AI applications, market positioning and publicly disclosed funding.

50	10	20	\$239.2 M
companies researched	countries represented	fields per record	disclosed funding captured*

*Numeric publicly disclosed amounts established in the dataset; not an estimate of total capital raised by all 50 companies.

Prepared as a client-facing market research and funding intelligence deliverable

1. Executive Summary

This research examines a sample of 50 AI-focused companies operating across African markets, mapping where AI businesses are being built, what problems they address, how they commercialize their products, and what publicly disclosed funding is visible.

The dataset covers 20 structured fields per company, including location, founding year, AI focus, industry, product or service, target market, business model, funding stage, disclosed funding, latest funding activity, investors and supporting sources.

Egypt, Nigeria and Kenya each account for 10 researched companies, followed by South Africa with 8. Predictive Analytics is the largest AI-focus category, Enterprise Software is the largest industry category, and B2B SaaS is the most frequently recorded business model.

The dataset contains \$239.2 million in numeric publicly disclosed funding across 37 companies. Thirteen companies do not have a numeric funding amount established. Unavailable amounts were not estimated.

2. Market Snapshot

Dimension	Research finding
Geographic concentration	Egypt, Nigeria and Kenya each contribute 10 companies; South Africa contributes 8.
Leading AI focus	Predictive Analytics — 14 companies.
Leading industry	Enterprise Software — 18 companies.
Leading business model	B2B SaaS — 18 companies.
Funding visibility	37 companies have numeric disclosed funding; 13 do not.
Disclosed funding represented	\$239.2M across records with an established numeric amount.

3. Geographic Distribution

The sample is concentrated in several established African technology ecosystems. Egypt, Nigeria and Kenya each represent 20% of the researched records, while South Africa represents 16%. The remaining records extend across Ghana, Uganda, Tanzania, the Democratic Republic of the Congo and Gabon.

This distribution describes the researched sample rather than the absolute size of each country's AI ecosystem. Public visibility, available information and the project's inclusion criteria influence which companies could be identified and verified.

4. AI Technology Landscape

Predictive Analytics appears in 14 records, making it the largest AI-focus category. AI Automation and Generative AI follow with 9 companies each. NLP and Machine Learning account for 6 each.

The mix indicates that the researched market extends beyond generative AI. Companies are applying AI to prediction, workflow automation, language processing, operational decision-making and specialized industry problems.

5. Industry Landscape

Enterprise Software is the largest industry category with 18 companies, followed by Fintech with 6 and Healthcare with 5. Agriculture accounts for 4 companies, with additional activity across energy, climate technology, e-commerce, logistics, mobility, education, manufacturing and security.

The distribution shows substantial representation of business-facing AI products, including credit decisioning, healthcare workflows, agricultural intelligence, logistics, energy management and enterprise

automation.

6. Commercial Models

B2B SaaS is the most frequently recorded business model, appearing in 18 companies. B2B2C appears in 8 records and B2B in 7. The prevalence of business-facing models is consistent with the strong Enterprise Software representation in the sample.

7. Funding Intelligence

Funding research was conducted separately from general company research so that financing claims could be independently supported. Thirty-seven companies have a numeric publicly disclosed amount recorded, while 13 do not.

The \$239.2 million represented in the dataset is concentrated among a relatively small number of companies. Terra Industries has the largest recorded amount at \$52.0M, followed by FlapKap at \$37.6M and Aerobotics at \$27.0M.

Largest Disclosed Funding Records

Company	Country	Disclosed funding	Stage
Terra Industries	Nigeria	\$52.0M	Seed
FlapKap	Egypt	\$37.6M	Pre-Series A / Other
Aerobotics	South Africa	\$27.0M	Series B
Si-Ware Systems	Egypt	\$19.0M	Venture Round / Other
Intella	Egypt	\$16.9M	Series A
DataProphet	South Africa	\$10.0M	Series A
Leta	Kenya	\$8.0M	Seed
Indicina	Nigeria	\$6.8M	Seed
DXwand	Egypt	\$6.3M	Series A
AI Diagnostics	South Africa	\$5.2M	Pre-Series A

8. Funding Stage Landscape

The dataset contains companies at multiple financing stages, with Seed and Pre-Seed representing the largest conventional groups. Several records are classified as Other because their latest financing involved accelerator funding, grants, growth financing, non-equity assistance, venture rounds or structures outside the controlled categories.

9. Key Research Findings

1. Egypt, Nigeria and Kenya each contribute 10 companies, making them the largest country groups in the researched sample.
2. Predictive Analytics is the largest AI-focus category, showing substantial activity outside the current generative-AI wave.
3. Enterprise Software is the largest industry category, with 18 companies building AI-enabled products for organisational use.
4. B2B SaaS is the most common recorded commercial model, reinforcing the enterprise orientation of the sample.
5. Funding disclosure is uneven: 37 companies have numeric disclosed funding while 13 do not.

6. The largest disclosed funding records are concentrated among a small number of companies, so aggregate funding should be interpreted alongside company-level figures.
7. The sample includes both major technology ecosystems and less represented African markets.

10. Research Quality & Verification

Company and funding information were recorded separately so major claims could be traced to appropriate evidence. Primary company sources were preferred for identity and product information, while funding announcements and reputable business or technology sources were used for financing evidence.

Where information could not be established confidently, it was not fabricated. Missing funding amounts, unresolved details and verification issues were retained and documented.

11. Limitations

This is a 50-company research sample, not a complete census of African AI companies. Public information varies significantly by company, country and funding event. Sources may report different founding years, locations or funding figures, and funding databases may use different definitions of total funding.

The findings should therefore be used as a structured research view of the identified sample rather than as a definitive measurement of the entire African AI market.

12. Deliverables

File	Purpose
African_AI_Startup_Research.xlsx	Full 50-company research dataset with 20 fields per record.
African_AI_Startup_Research.csv	Portable version of the structured dataset.
Research_Summary.pdf	Client-facing market and funding intelligence report.
Project_Overview.pdf	Research scope, methodology, sources and verification framework.
Data_Research_Portfolio.ipynb	Supporting technical evidence of collection, cleaning, validation and analysis.

Source note: The underlying dataset contains company and funding source URLs for relevant records. This report summarizes those research records and does not replace the source trail.
